Temperature Ratings

ATTENTION

Temperature Ratings involve many variables which include: personal body metabolism, air humidity, wind speed, body size, type of shelter, type of sleeping clothing, sleeping mat, and type of food and drink recently consumed.

Extreme Rating - this is a rating where the sleeping bag will provide some comfort to the user in emergencies or extreme, and unexpected, weather changes.

Comfort Range - this is the target range for a particular model of sleeping bag to be used and when selecting a model.

Note: there is no standardized and regulated program to establish Temperature Ratings. Be attentive when making a selection to compare bag sizes, materials and weights before focusing on temperature ratings. We also recommend purchasing from retailers with staff properly trained in sleeping bag selection.
